

Job Search AI Agent

A resume-aware career workspace for discovery, decisions and interview readiness.

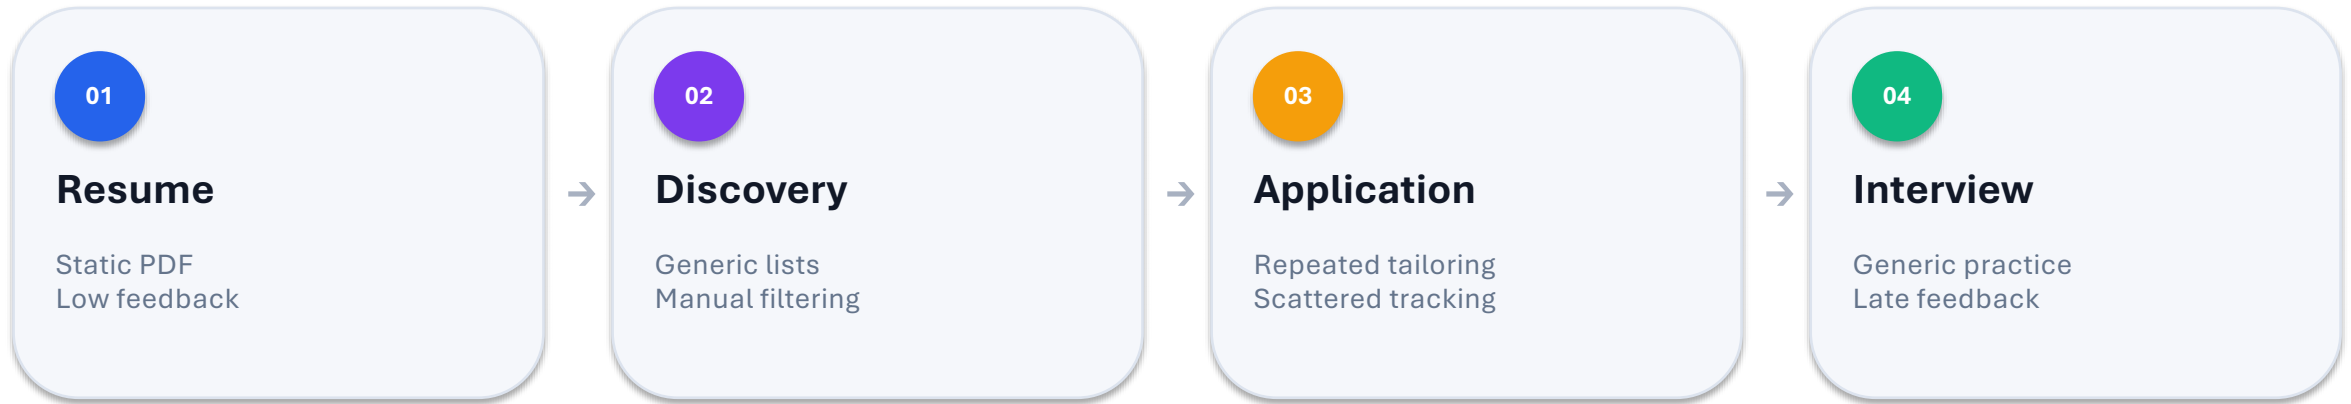

Gangadhar R • Gururaj S H • H M Akshay • Mallikarjunayya S

Capabl project presentation • 2-month build

The job search is a broken chain of context

Candidates repeatedly translate the same experience across disconnected tools.

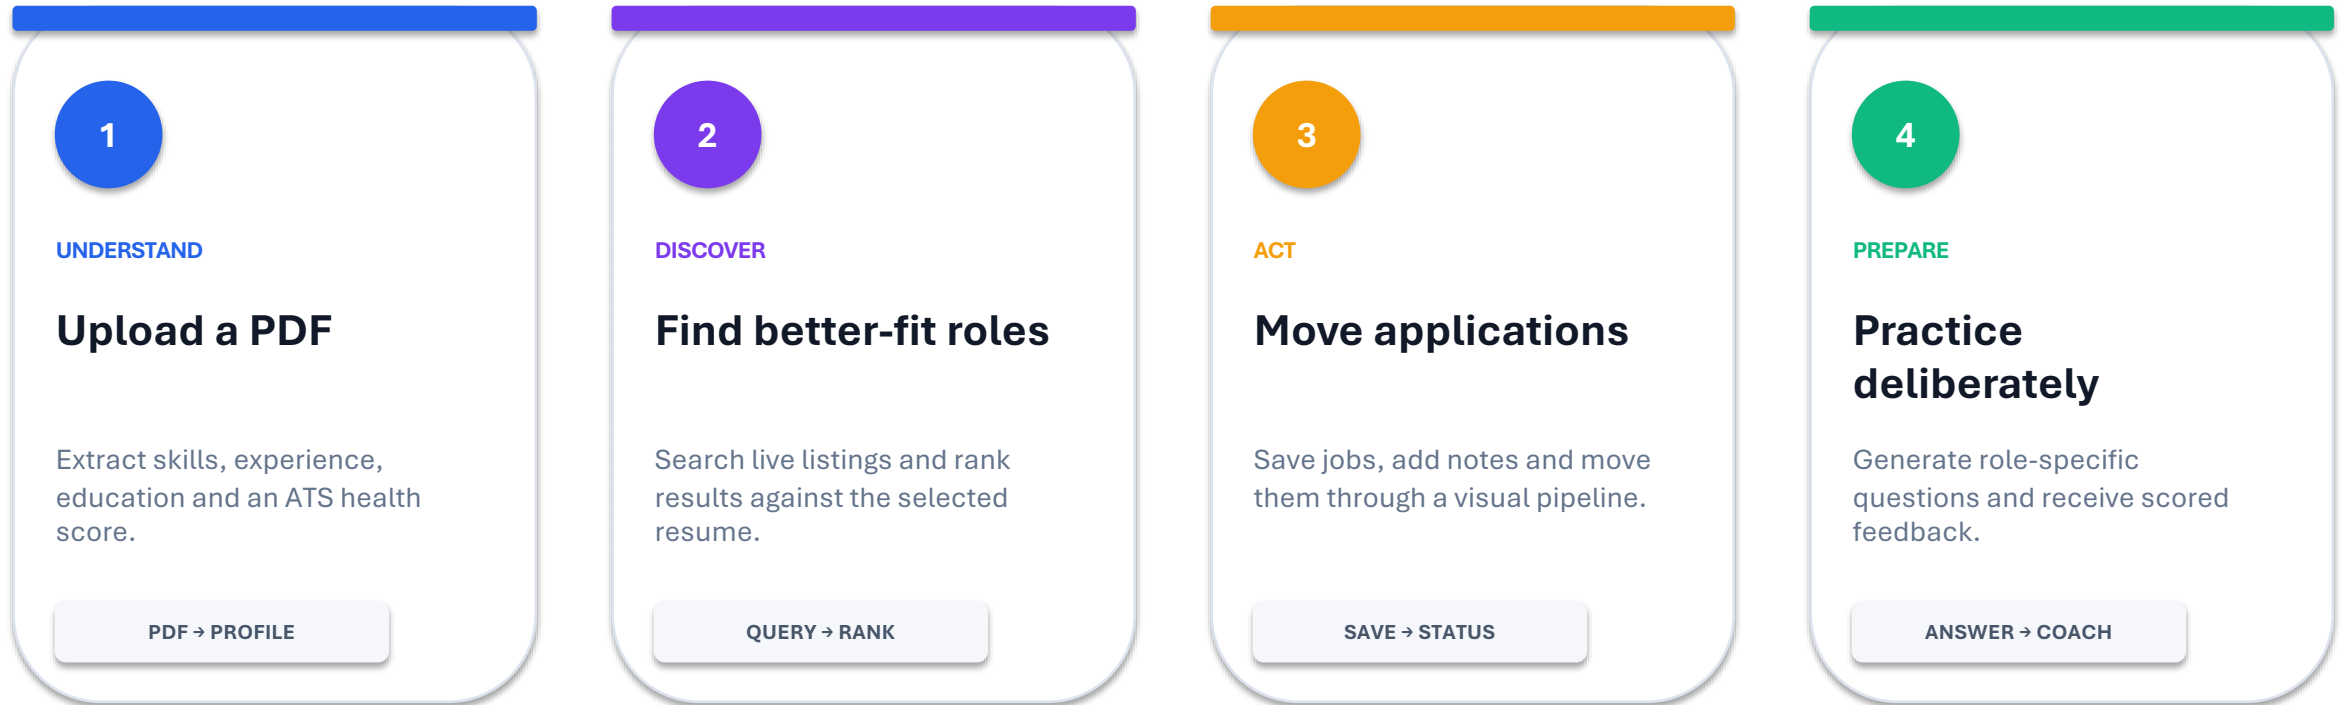

PRODUCT THESIS

Keep the resume as shared context—then use it to rank opportunities, guide applications and personalize preparation.

One workspace. Four connected decisions.

The React experience turns a resume into a continuous career workflow.

From PDF to a usable career profile

Deterministic extraction establishes the profile; Gemini fills the narrative gap when needed.

01

Text extraction

pdfplumber reads text from PDF resumes; uploads are capped at 5 MB.

02

Structured signals

Rules identify known skills, education, companies and years of experience.

03

ATS health

A transparent heuristic scores skills density and profile completeness.

04

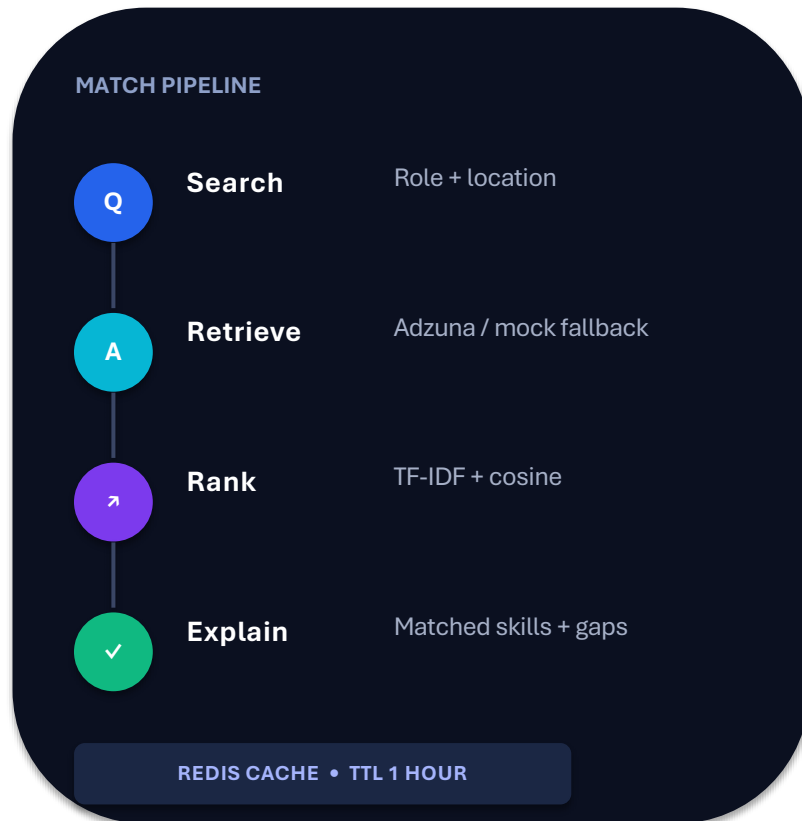

Stored context

Parsed data, raw text and a TF-IDF vector are persisted with the resume.

Note: the ATS score is guidance—not a prediction of any employer's ATS.

Rank the search. Explain the fit.

Search results become decisions when relevance and next actions are visible together.

MATCH

MATCHED

Python FastAPI REST

SKILL GAPS

AWS Kubernetes

AI NEXT ACTIONS

- Tailored improvement suggestions
- Cover-letter draft for the role
- Role-specific interview tips
- Graceful fallback if Gemini fails

Turn matches into momentum

The workspace continues after discovery: track every application and rehearse for the next conversation.

MOCK INTERVIEW

Question 3 of 5 TECHNICAL

How would you design a resilient job-search API with cached results?

Answer is evaluated against a role-aware framework.

8.4 / 10

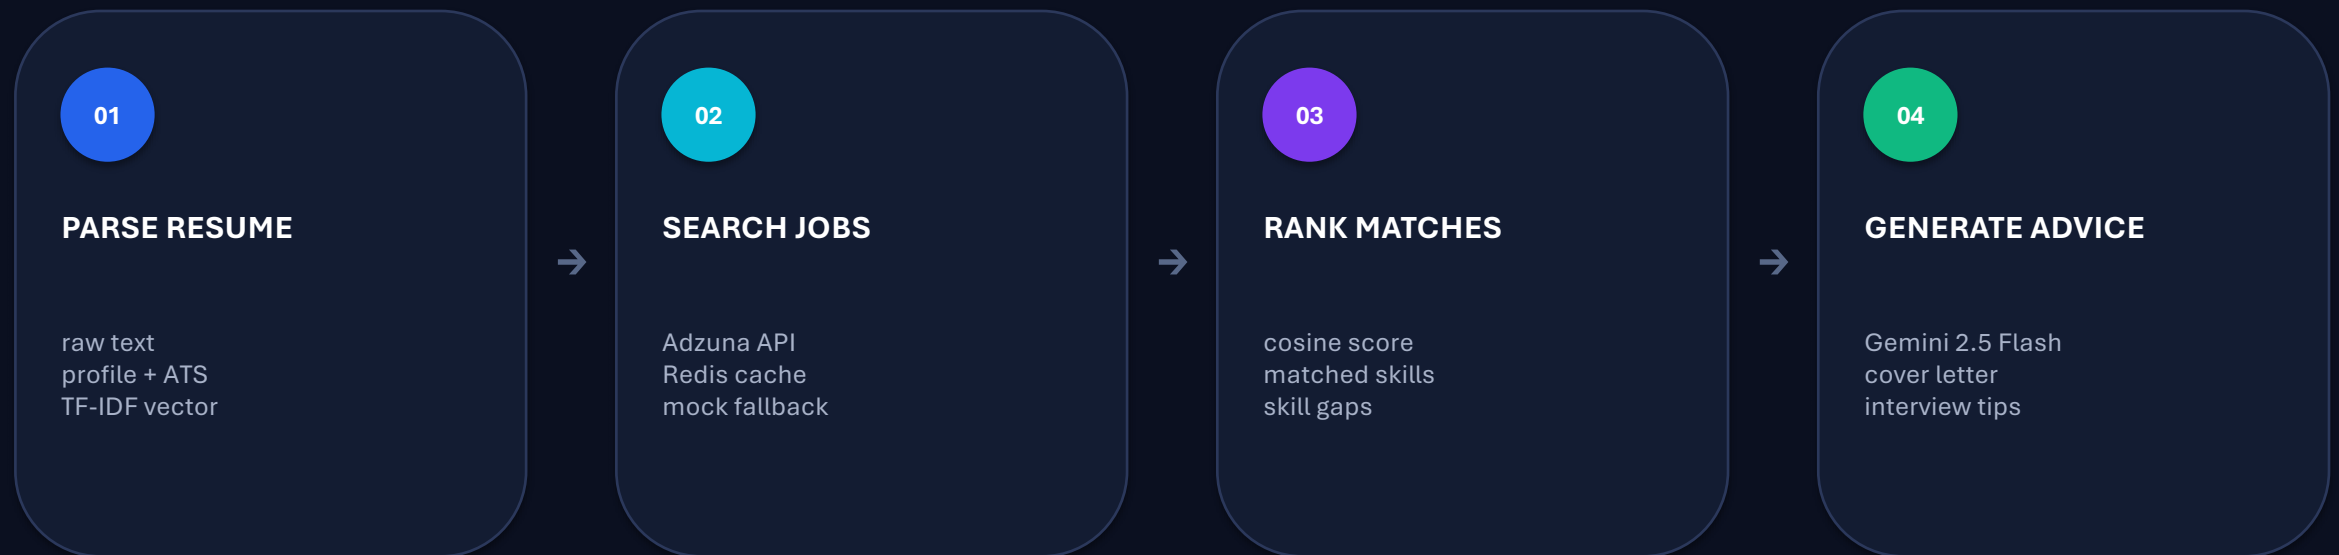

Strengths **Improve**

Clear trade-offs Add metrics

Technical • Behavioral • Situational • HR

A stateful four-node career agent

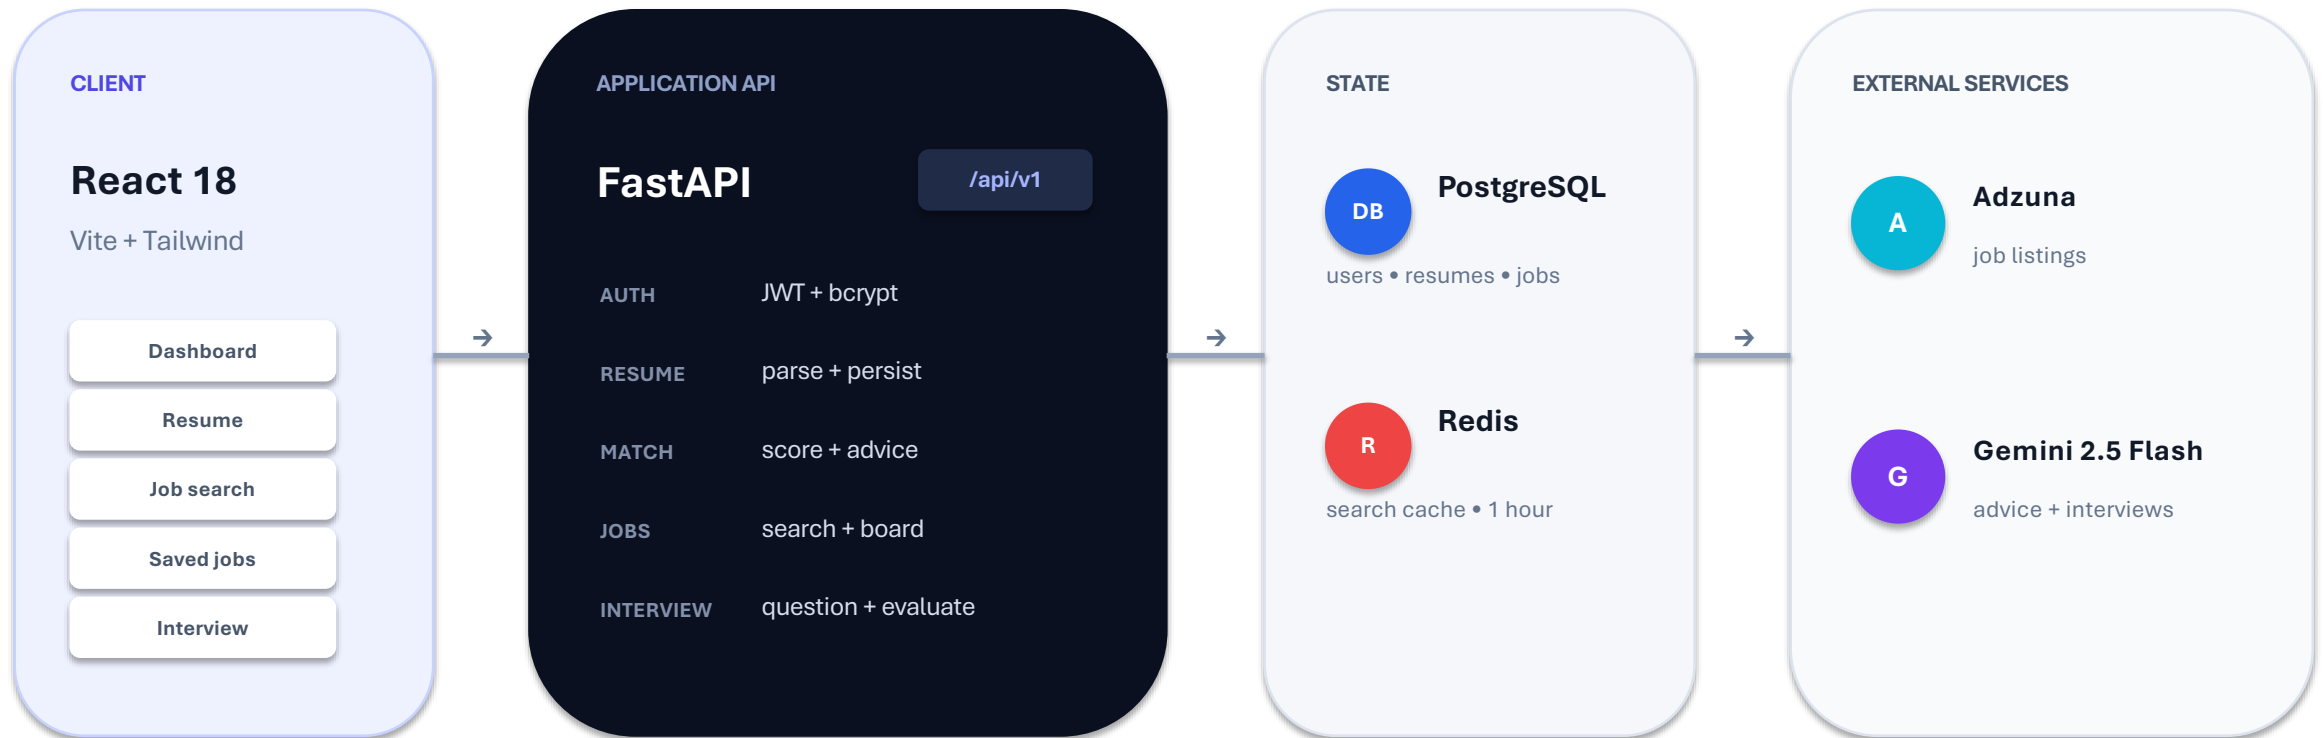

LangGraph makes each step explicit, testable and observable.

**STATE**

Inputs and outputs accumulate across nodes; errors stop safely, and missing results skip advice.

Decoupled product, data and intelligence layers

A versioned REST API connects the React client to persistent state and external services.

What is built—and what gates production

The current codebase is feature-complete for local demonstration, with explicit hardening work documented.

53

backend tests passing

Agent, auth, interview, jobs, matching, resume parsing and users.

19

versioned API routes

FastAPI endpoints across agent, auth, interview, jobs, match, resume and users.

5

product workspaces

Dashboard, resume, search, saved jobs and mock interview.

DEPLOYMENT PATH

Frontend Vercel • npm build

Backend Docker • Railway config

Local Docker Compose • PostgreSQL • Redis

PRODUCTION GATES

- Enforce ownership checks on data routes
- Require a strong secret + restrict CORS
- Align backend host config and migrate Gemini SDK

A strong foundation for a smarter career loop

The product already connects context across the journey; the next work improves trust, intelligence and reach.

NOW

Demo-ready

- Resume intelligence
- Ranked discovery
- Application board
- AI mock interviews

NEXT

Production-safe

- Route ownership
- Secret + CORS policy
- SDK migration
- Deployment alignment

LATER

Learning system

- Richer embeddings
- Feedback-driven ranking
- Notifications
- Outcome analytics

CareerAI turns a resume from a document into **shared context for every career decision.**

THANK YOU
